

Courier V4.0 Installation Overview

1. Use the Red Hat Kickstart file to create a Red Hat Enterprise V6.0 installation.
2. Create user account called 'iseeuglobal' during the first boot process.
3. Change network settings to suit environment.
4. Change Firewall settings to include https.
5. Change SELinux to off or passive.
6. Copy the 'current' directory to the iseeuglobal desktop.
7. Change the user on the command line to root with the 'su -' command.
8. On the command line change the permissions on the 'current' directory to be fully open to avoid errors when running the script with the command 'chmod 777 -R current'.
9. Run the installation script with the command './courier4_0_install_script'.
10. Follow the instructions prompted on the screen.
11. Once the installations is complete and the configuration files edited reboot the server and test the installation.

Post Installation Tasks

1. Use the Certificate Request file created during the installation (.csr) to apply for a line certificate from a known Certificate Authority to replace the self signed certificate and modify the httpd-ssl.conf file as required.
2. Fully test the service by logging into the system and publishing file(s) with the account 'iseeuglobal' and password 'scherZo'.
